## ! UI / UX Issues

### No feedback or guidance when messaging fails — Instagram

UX

Omnichannel — Instagram

When attempting to send a message by entering both a user email address and a username, no message is received by the target account and no informative error is shown. If the channel requires a different approach (e.g. a connected business account or a specific ID format), the system should clearly guide the user rather than silently failing.

**IMPACT** Users have no way to understand why their message was not delivered or how to fix it. Silent failures with zero guidance are a critical UX failure that will cause immediate user drop-off.

### No feedback or guidance when messaging fails — Telegram

UX

Omnichannel — Telegram

Sending a message by entering both a username and a phone number results in no delivery and no meaningful error message. If Telegram requires a bot-based flow or a specific identifier format, the interface must explain this to users before they attempt to send.

**IMPACT** Same impact as Instagram: users are left guessing with no actionable path forward, making the channel effectively unusable on first attempt.

### Web channel tab duplicated three times in navigation

UX

Omnichannel — Web

The 'Web' tab appears three times in the Omnichannel navigation. This is likely caused by a rendering or routing bug that registers the same component multiple times.

**IMPACT** Duplicate tabs create confusion, clutter the interface, and undermine user confidence in the platform's reliability. Each duplicate tab may also trigger redundant API calls.

### No feedback or guidance when messaging fails — Messenger

UX

Omnichannel — Messenger

Adding an email address and attempting to send a message to the same account results in no delivery and no helpful error. If Messenger requires a page-connected flow or a different identifier, the UI must communicate this clearly.

**IMPACT** Messenger is non-functional for new users without any setup guidance, mirroring the issues found in Telegram and Instagram.

### No feedback or guidance when messaging fails — WhatsApp

UX

Omnichannel — WhatsApp

Adding a phone number and attempting to send a test message results in no delivery. No error or setup guidance is shown. If WhatsApp requires a connected business number or an access token, this must be communicated clearly in the UI.

**IMPACT** Without guidance, users cannot complete WhatsApp setup. Combined with the missing access token issue (see Auth section), this channel is completely non-functional.

## X Critical Functional Bugs

### AI Studio — Content Factory entirely non-functional (500)

Bug

Marketing — AI Studio

All content generators within Content Factory fail immediately. Every attempt to generate any content type triggers a 500 Internal Server Error from the 'ai-marketing' Supabase Edge Function. The entire feature is unusable.

```
POST .../functions/v1/ai-marketing — 500 (Internal Server Error)
```

**IMPACT** Content Factory is the core AI content generation tool. A 500 on the Edge Function means the backend is crashing server-side, blocking all marketing content creation.

### AI Studio — Image Factory non-functional (500)

Bug

Marketing — AI Studio

Attempting to generate an image via Image Factory triggers the same 500 Internal Server Error from the 'ai-marketing' Edge Function. No images can be generated.

```
POST .../functions/v1/ai-marketing — 500 (Internal Server Error)
```

**IMPACT** Image generation is completely blocked. Social posts requiring images (e.g. Instagram, see below) cannot be created, creating a cascading failure across modules.

### AI Studio — Campaign Planner non-functional (500)

Bug

Marketing — AI Studio

The Campaign Planner throws a 500 error from the same 'ai-marketing' Edge Function. No campaign plans can be generated or viewed.

```
POST .../functions/v1/ai-marketing — 500 (Internal Server Error)
```

**IMPACT** Campaign planning is entirely blocked. The root cause is shared with Content Factory and Image Factory — a single broken Edge Function is taking down the entire AI Studio.

### AI Studio — Quick Actions 'Generate Content Ideas' non-functional (500)

Bug

Marketing — AI Studio

The Quick Actions panel's 'Generate Content Ideas' feature also calls the same broken 'ai-marketing' Edge Function and fails with a 500 error.

```
POST .../functions/v1/ai-marketing — 500 (Internal Server Error)
```

**IMPACT** Every AI-powered feature in the Marketing module is broken due to a single unresponsive Edge Function. This must be treated as the highest-priority fix in the Marketing section.

### Email Quick Send not delivering messages

Bug

Marketing — Email

Sending a test email via Quick Send shows no error on screen, but the recipient never receives the message. The email silently fails somewhere in the delivery pipeline.

**IMPACT** Silent failures are especially harmful because users believe the email was sent successfully. End-to-end delivery confirmation and user-facing error messages are required.

### Social publishing blocked — Facebook token expired, Instagram missing image, WhatsApp token absent

Bug

Marketing — Social

Attempting to publish a post to all channels simultaneously reveals three separate errors: (1) Facebook OAuthException — the access token expired on April 3, 2026, while the session is from April 9, 2026; (2) Instagram requires an image to be generated first, but Image Factory is broken (see above); (3) WhatsApp has no access token stored.

```
Facebook: OAuthException (code 190, subcode 463) — Session expired 03-Apr-26. Instagram: image required. WhatsApp: No access token stored.
```

**IMPACT** Social publishing is completely non-functional across all three channels. This is a cascading failure: fixing AI Studio (Image Factory) and renewing tokens are both prerequisites to restoring social publishing.

### CRM sync returns 500 internal server error

Bug

Sales & CRM

Syncing contacts from HubSpot, Salesforce, and Pipedrive all fail with a 500 Internal Server Error from the 'crm-sync' Edge Function. The function is reachable but crashing at runtime.

```
POST .../functions/v1/crm-sync — 500 (Internal Server Error)
```

**IMPACT** No CRM contacts can be imported or updated from any supported platform, blocking all sales workflows dependent on CRM data.

### HR performance statistics permanently stuck at zero

Bug

HR & Team — Performance

All performance metrics and statistics display zero regardless of team activity. The data aggregation pipeline or background job is either misconfigured or not running.

**IMPACT** The performance tracking module is entirely non-functional. Managers cannot evaluate or monitor team output through the platform.

### Task creation fails — null value violates database constraint

Bug

Time Management — Tasks

Creating a new task fails because the 'time' column in 'personal_tasks' does not allow null values, yet the creation form does not require a time input. This schema mismatch causes every creation attempt to be rejected with a 400 error.

```
null value in column "time" of relation "personal_tasks" violates not-null constraint.
POST /rest/v1/personal_tasks — 400 (Bad Request)
```

**IMPACT** No tasks can be created at all. Fix: require the 'time' field in the UI form, or make the database column nullable.

### Knowledge Base file upload stuck in 'Processing' state indefinitely

Bug

Knowledge Base

Uploaded files enter a 'Processing' state and never complete ingestion. Files remain permanently unavailable for use.

| IMPACT | No documents can be added to the Knowledge Base, blocking all AI-driven search and knowledge retrieval features that depend on this module. |
|---|---|

### Legal Advisor chatbot non-functional (500)

Bug

Legal Advisor

Attempting to start a chat with the Legal Advisor bot triggers a 500 Internal Server Error from the 'ai-legal' Edge Function. The bot does not respond.

```
POST .../functions/v1/ai-legal — 500 (Internal Server Error)
```

| IMPACT | The Legal Advisor feature is entirely inaccessible. Any users relying on it for automated legal guidance are completely blocked. |
|---|---|

## → Summary & Recommended Actions

**Immediate priority — backend failures**

- Fix the 'ai-marketing' Edge Function (500) — this single issue is blocking ALL of AI Studio: Content Factory, Image Factory, Campaign Planner, and Quick Actions.
- Fix the 'ai-legal' Edge Function (500) — the Legal Advisor is completely inaccessible.
- Fix the 'crm-sync' Edge Function (500) — no CRM contacts can be synced from HubSpot, Salesforce, or Pipedrive.
- Run the DB fix for task creation: require the 'time' field in the UI form or make the column nullable in 'personal_tasks'.
- Investigate and fix the Knowledge Base ingestion pipeline for stuck 'Processing' uploads.

**High priority — auth & tokens**

- Renew the Facebook/Messenger access token (expired April 3, 2026) and re-link in Settings.
- Store and link a valid WhatsApp access token to restore WhatsApp messaging and publishing.
- Audit all OAuth token expiry policies — implement proactive alerts before tokens expire.

**High priority — UX & onboarding**

- Add clear setup guidance and error messages for all Omnichannel channels (Instagram, Telegram, Messenger, WhatsApp) — specify required format, account type, and connection steps.
- Fix the Web channel tab duplication bug in the Omnichannel navigation.
- Add end-to-end delivery confirmation to Email Quick Send and surface errors to the user instead of failing silently.
- Investigate and fix the HR performance data aggregation pipeline.
